

CLAIM AMENDMENTS:

Claim 1 (Currently Amended): A foam material modular toy structure, comprising:

~~consisting~~ a plurality of differently shaped solid components, each being fabricated from ~~a~~ an elastic foam material, ~~wherein~~ each solid foam component having at least one of ~~has~~ an octagonal through-hole and a projecting umbrella-shaped tenon, with the tenon of one of the solid components being insertable into the octagonal through-hole of another one of the solid components, such that when users manually assemble the solid components ~~them~~ according to their own creativity by inserting the tenon into a corresponding octagonal through-hole, the solid components ~~insertional fitting,~~ they are conjoined into imaginative toys; at the same time, ~~an~~ the insertional coupling formed by the inserting of the tenon into the corresponding octagonal through-hole ~~at the said umbrella-shaped tenons and the said octagonal through-holes of each said solid foam component~~ provides for rotatably controlled joint applications, with each said solid foam component being capable of being articulated at a range of angles and kept in a fixed position without collapsing due to weight factors, thereby enabling an the assembled toy to be flexible and lively;

~~additionally, since~~ wherein the elastic foam material has an inherent elasticity that allows ~~and the said umbrella-shaped tenons~~ to ~~can~~ be manually withdrawn from the said octagonal through-holes, thereby allowing the assembled entire toy to be is easily disassembled into constituent parts to reduce space occupancy and facilitate storage, so that the invention herein is thereby capable of providing for repeated creative assembly as well as lively and flexible operational performance.

Claim 2 (Currently Amended): ~~As mentioned in Claim 1 of the~~ The foam material modular toy structure recited in claim 1 of the invention herein, wherein the said umbrella-shaped tenons and as well as the said octagonal through-holes are adapted to maintain the ~~that function as the interconnective means for the assembly and conjoinment of the said solid foam components are also capable of maintaining them in~~ a fixed position.
